WikiSuite: The most comprehensive and integrated Open Source enterprise solution.

Bootstrap

How will the user experience be consistent throughout the various components of WikiSuite? We will work to convert all apps to Bootstrap, and ideally with some or all themes from Bootswatch.

Done

- Tiki converted to Bootstrap 3 in Tiki 13, along with Bootswatch, Bootstrap 4 in Tiki 19 and Bootstrap 5 in Tiki 25.
- Virtualmin: Webmin/Usermin/Virtualmin/Cloudmin theme based on Bootstrap and Font Awesome
- Syncthing uses Bootstrap since day 1, and Bootswatch was added recently.
- FusionPBX done
- Converse-> Done in 4.0.
  - And later Bootstrap 5: https://github.com/conversejs/converse.js/pull/3437
- Openfire admin panel: Done in version 4.5 as part of an admin panel modernization
  - https://discourse.igniterealtime.org/t/openfire-4-5-0-is-released/87004
  - https://github.com/igniterealtime/Openfire/pull/1460
- Cypht: https://github.com/cypht-org/cypht/pull/828

Being worked on

- MeshCentral: https://github.com/Ylianst/MeshCentral/issues/6333

On hold

- Openfire includes Jitsi Meet and ConverseJS.
  - Jitsi Meet: https://github.com/jitsi/jitsi-meet/pull/585
    - Some responsive fixes to Openfire Meetings were done as a stopgap measure, until Jitsi Meet is converted to Bootstrap, and makes its way into Openfire.

Discussion started

- H5P: On 2016-05-31, this topic was discussed (in the context of H5P integration in Tiki) and this will be explored further in future discussions.

Low priority

- Xibo
  - The UI is quite nice already, so no rush.
